```
73 -- 8. Tell me about check constraints: What are they? What are they good for? What's the
74 -- advantage of putting that sort of thing inside the database? Make up some examples
75 -- of good uses of check constraints and some examples of bad uses of check constraints.
76 -- Explain the differences in your examples and argue your case
77
78 -- Check Constraints are good for ensuring that data value is within a certain range; The data is checked and either True or False is Returned
79 -- If you want to guarantee that the data is less than, greater than a certain value, this can be done with Check Constraints
80 -- The advantage of putting it in a database is to make sure that the Data stored is consistant and conforms to a certain standard
81 --
82 -- A good example would be
83 -- Create Table ClassicMovies (
84 --     name text,
85 --     year int,
86 --     CHECK (year < 1990));
87 -- This Constraint will ensure any film in this "ClassicMovies" table is from before 1990
88 --
89 -- A bad example would be
90 -- Create Table ClassicMovies (
91 --     name text,
92 --     productionyear int,
93 --     publishyear int
94 --     CHECK (publishyear > productionyear));
95 -- This Constraint is bad, because it eliminates the possibility of inserting a movie published in the same year it was produced.
